

Privileged Access Management

Monitor and Protect those with the Highest Access

Why You Need It

Privileged Access Management (PAM) is the monitoring and protection of privileged (super user) accounts in an organization's IT environment, which are the most common targets of attack.

PAM is a holistic set of technologies and processes designed to create, modify, control access to and terminate privileged access.

Oversight is necessary so that the greater access abilities of super user accounts are not misused or abused.

How You'll Benefit

- » Risk Reduction: Protect sensitive access to critical devices and systems where users may leak confidential information, change transactions and remove audit trail.
- » Policy Improvement: Enable continuous and sustainable policy enforcement over administrative and root accounts across the organization, ensuring established business and security policies are continuously followed.
- » Compliance Alignment: Detect, monitor and report on privileged account activity, improving the audit process and meeting compliance guidelines.
- » Visibility Improvement: Identify and monitor both privileged accounts and their usage.

Success Story

This Top 10 Investment Bank in the World had an immediate need for 24/7 operations and support. They lacked the processes necessary to manage their huge number of privileged accounts from their infrastructure. They also suffered a poor state of security control. Their helpdesk, branch support professionals, and auditors experienced many problems trying to perform their own tasks as well as some difficulties in investigation of incidents.

With Simeio Solutions, this investment bank achieved:

- » Successful migration to new IAM: 3.2 million external identities lined up for end-user (citizen) self service. With an SLA based operational support, achieved 99.9% availability.
- » Controlled & On-demand elevation to temporary administrative access for employees. Resulted in huge improvement in productivity, helpdesk tickets, and compliance.
- » Simeio defined and implemented emergency access or "Break glass" process for 50 business critical financial applications. Additionally, provided Jefferies a hassle-free tool for managing all vendor support tickets in one place.
- » As the Jefferies' preferred IAM advisor, Simeio introduced industry standards and best practices for IAM, PAM and VD services and processes.

» The Simeio Difference

Simeio Privileged Access Management (PAM) is the only way to know that your super user accounts within your organization are truly secure.

Simeio PAM automates compliance reporting with integration to existing access governance and multi-factor authentication infrastructure. Your privileged users know a lot about your company...but with Simeio PAM, you'll know even more.

You get the latest, best-in-class PAM technologies with reliable 24/7 monitoring and support – with no hardware or capital investments, lengthy integrations, migrations or upgrades required. We'll address serious and rapidly changing security threats while minimizing the impact on your organization, employees and customers.

» Simeio Professional Services

Our Advisory Services team enables our customers to quickly launch or expand their IAM Programs, achieving on average a 60 percent faster time-to-market than traditional IAM implementations.

» Free PAM Assessment

Assess your Privileged Access Management Program with a complimentary quick-start assessment workshop delivered by our subject matter experts.

We use industry-forged consultative processes and leverage our Simeio-defined best practices to assess the scope of your Privileged Identity Management Program. This can help you to prioritize initiatives and educate your business on how to best retain compliance and security, while keeping your organization out of the news for the wrong reasons.
