

GET YOUR HEAD IN THE CLOUD

MANAGE YOUR CLOUDS WITH SIMEO

In a digital landscape of continually expanding identities and identity systems across not just a single cloud, but multiple clouds from different providers, users are finding it more challenging to secure and manage their identities. In addition, each cloud platform brings their own entitlements and security policies that further complicate the challenge and potentially result in inappropriate or excessive access to cloud workloads.

Cloud Infrastructure Entitlement Management (CIEM) has emerged as the answer to this problem, coordinating and managing the entitlements across all these clouds.

CIEM SERVICES

Unmanaged Clouds Present Challenges...and Risks

Hundreds of cloud-native roles and thousands of permissions: A higher risk of unauthorized access because of excessive permissions.

Disparate operational and security paradigms for each cloud platform: Impaired visibility, situational awareness, and ability to respond to security events.

Identities with excessive permissions impact utilization of cloud services: Standing access even with least privilege worsens your risk posture and creates a persistent security threat when an identity is compromised.

**NAVIGATE THE RISKS AND
CONQUER THE CHALLENGES OF
UNMANAGED CLOUDS.**

CIEM is the Modern Solution

Organizations adopting multiple cloud platforms face challenges in enforcing a streamlined security policy. CIEM tools solve this challenge by orchestrating diverse cloud platforms and SaaS applications via an identity centric entitlements map. This helps with visibility, monitoring, and enforcement of common security policy while simplifying remediation, automation and just-in-time access. A CIEM solution grants users gain full visibility, understanding, and control of their cloud environments.

A CIEM service gathers all your AWS, Azure, and Google cloud services together under a single pane of glass. CIEM un-siloes your disparate cloud services and provides real-time information and control across all the cloud platforms used by your enterprises. In the short term, CIEM adoption augments your Cloud Infrastructure and Platform Services (CIPS) and Cloud Security Posture Management (CSPM) products. In the long term, it ensures that your identity fabric never has a single stitch out of place.

Simeio CIEM Offering

Simeio is the industry leader in identity security services. Is it any surprise that our CIEM offering is the most security-minded option on the market? Simeio's CIEM offering combines our identity security expertise with the industry leading commercial CIEM products.

Our CIEM offering provides comprehensive visibility and control over all permissions and entitlements within your clouds. Beyond providing a unified platform where you can assess, manage, govern, and consistently protect your permissions and identities, Simeio provides expertise to help automate policy enforcement.

Automatic policy enforcement, real-time monitoring, remediation, and automated curation of identities ensures you always know what is happening in your clouds.

Additionally, Simeio cuts down on the effort and cost needed to manage entitlements. We reduce the risk of misconfiguration for identities in multiple clouds. This helps prevent cloud breaches and data theft by reducing the attack surfaces as well as minimizing the access risks posed to your cloud by excessive permissions of machine identities.

Simeio CIEM Deliverables

➤ CIEM tenant setup & integrations

➤ Risk analysis report

➤ Remediation and just-in-time access templates

➤ Configurations Runbook
